GORRE DINESH CHANDAN REDDY

7416767453 — gorredinesh21@gmail.com — GitHub — Portfolio

Data / AI Engineer at Reliance Industries — enterprise data platforms (Azure, Databricks) and GenAI systems (RAG, agents, voice); independently builds and operates a live AI-powered marketplace.

Education

Indian Institute of Technology (ISM), Dhanbad — Bachelor of Technology, Computer Science and Engineering *Dec 2021 – May 2025*

Experience

Reliance Industries Ltd.
Aug 2025 – Present
Graduate Engineer Trainee (Data / AI Engineer) *Mumbai, India*

- **Natural-Language Access to Enterprise Data** — Gave business users a way to ask questions in plain English and get answers straight from enterprise data, by extending **Databricks Genie** beyond its native platform.
- **Query Routing with a Metadata Graph** — Designed a **graph index over table and column metadata** that reads each question, finds the right tables and sends the query there — so answers come from the correct datasets across the enterprise data estate.
- **Voice-First Analytics** — Added streaming **speech-to-text and text-to-speech** so the same platform answers by voice: users speak a question, the data answers out loud.
- **Production Web App, REST & OAuth** — Built the external application that delivers it — REST API services and OAuth 2.0 login — running as production software outside Databricks.
- **One DataOps Platform from Three Systems** — United MES, SAP and workforce data through production pipelines on **Azure Data Factory, ADLS Gen2 and Azure Databricks** — downstream analytics reads from one place now.
- **Delta Lake Medallion, Raw to Gold** — Owned the flow from raw ingested data through **Bronze, Silver and Gold** in Azure Databricks, producing the clean tables that KPI and reporting workloads depend on.
- **Plant Data Products** — Shipped MES analytics as datasets, KPI notebooks and **Databricks dashboards** for manufacturing operations.
- **Workforce Analytics** — Delivered attendance, attrition and workforce-metrics analytics as **Databricks dashboards** for workforce reporting.

Pepsales
Apr 2024 – May 2024
Backend / AI Intern *Bengaluru, India*

- **AI Proof-of-Concept, End to End** — Built the company's AI POC as its first engineering intern: read sales-meeting transcripts (PDF/DOCX), extracted the text and turned it into **structured customer insights** — pain points, requirements — through LLM prompts I designed.
- **Before the Frameworks Existed** — Owned every piece of the pipeline myself — document parsing, prompt design, LLM integration — **before frameworks like LangChain**, so every component was built from scratch.
- **Deployed and Adopted** — Developed and deployed **Flask** services on **AWS EC2**; the POC's flow became the core flow of the product.
- **Built for a Real Product** — The pipeline fed a **B2B SaaS platform that generates personalized product demos** — raw sales calls became the inputs those demos needed.

Projects

Homatri — Hyperlocal Home-Food Marketplace | Next.js, FastAPI, React Native, PostgreSQL, GCP Cloud Run, WhatsApp Business API, LangGraph, Razorpay | Website

- **Real Users, Real Orders** — Built and run a live home-food marketplace doing **40–50 orders a day** with **50+ registered home chefs** — customers order, chefs cook, riders deliver.
- **The Full Platform** — A Next.js web app, FastAPI backend, PostgreSQL database and **3 React Native Android apps** — one platform covering ordering, payments, location and delivery for all three sides.
- **Ordering by WhatsApp, End to End** — Customers order entirely inside WhatsApp: a **LangGraph** agent on the **WhatsApp Business API** chats with them, remembers each user (state checkpointed in Postgres) and calls **14 typed tools** against the same backend the apps use — register, browse, order, pay, track, cancel.
- **Voice Notes Become Orders** — Added voice-note ordering (Meta media download, energy gate, speech recognition) with a deterministic gate that stops the model inventing orders over silence; tuned **Gemini on Vertex AI** to reply in ≈**3s**.
- **Payments Done Right** — Real **Razorpay** integration: payment links minted deterministically, settlement confirmed only server-side via **webhooks and a poller** — never trusted from the client.
- **Real-Time Delivery Tracking** — **SSE order tracking**, WebSocket rider GPS and Maps geocoding, deployed on **GCP Cloud Run + Cloud SQL** with CI/CD and Android release builds — after consolidating an earlier 4-agent design into a single customer agent.

Feynman — Personal AI Companion Harness | Python, Gemini Live API (Vertex AI), SQLite + sqlite-vec, FastAPI, Android, LangGraph | GitHub

- **A Voice Agent That Actually Listens** — Real-time voice on the **Gemini Live API**: full conversation over one WebSocket, interruptible mid-word, tools callable mid-sentence — released as an **MIT open-source repo**.
- **Memory That Grows Overnight** — A **3-tier memory** — five identity files always in the prompt, a **2,178-note** long-term store with keyword + vector recall, and the raw session log — plus a nightly job that turns each day's conversations into durable notes (**retrieval eval 21/21**).
- **19 Tools, Safely Gated** — Memory, files, terminal, scheduling and agent-task tools declared to the model and dispatched by local code — with **spoken confirmation gates** before anything destructive runs, command blocklists and protected-process refusals.
- **The Phone Runs the Laptop** — An Android app plus a **token-authenticated FastAPI bridge** (Tailscale-only) lets the agent run the laptop remotely: shell commands behind approve/deny chips, screenshots fed back so it can **see the screen**, and headless coding-agent sessions it can start, check and stop.
- **Reverse-Engineered Protocol, Tested End to End** — Drove an **undocumented JSON-RPC protocol** (sessions, permissions, user prompts) to command a desktop agent app; **36 automated checks** including a headless live-session test — the suite caught two real bugs.

Open-Source Contributions

- **BrogueCE** (C, AGPL-3.0) — PR #918: hardened recording-playback and score-file I/O, defects found with **gcc -fanalyzer static analysis** (+70/8 across 5 files).
- **cloudwego/eino-ext** (Go, Apache-2.0) — PR #1023: fixed a **data race** where `toTools` mutated the shared tool schema (+131/2).
- **opencode** (TypeScript, MIT) — PR #55322: caches compiled wildcard-pattern regexes to cut repeated pattern-matching overhead.

Technical Skills

Languages: Python, Go, SQL, TypeScript / JavaScript, C / C++
Data Engineering: Azure Databricks, Delta Lake (Medallion), Apache Spark / PySpark, Azure Data Factory, ADLS Gen2, PostgreSQL
AI / GenAI Engineering: LangGraph, LangChain, RAG, function / tool calling, prompt engineering, Gemini / Vertex AI, LLM evaluation, MCP, Ollama
ML / Deep Learning: PyTorch, TensorFlow / Keras, NumPy, Pandas, computer vision, GANs
Cloud / Integrations / Delivery: GCP (Cloud Run, Cloud SQL, Vertex AI), AWS, Docker, CI/CD, WhatsApp Business API, Razorpay, OAuth, WebSockets / SSE

Achievements

- **Amazon ML Challenge 2024** (Amazon India) — finished in the **top ∼1% of 18,500+ teams** in a 72-hour national ML hackathon (OCR-based entity extraction over 260k product images)
- **Paytm Build for India AI Hackathon 2026**, Mumbai — selected among the **top 15 of ∼6,000 entries** for the in-person finale; built **Sahayak**, an autonomous UPI payment-failure support agent (LLM triage with deterministic SLA rails, automated NPCI dispute filing, voice in 5 Indian languages)
- **Codeforces** rating **1600+ (Expert)** · **500+ LeetCode** problems solved
- Secured AIR **2903** in JEE Advanced and AIR **4616** in JEE Main
