GORRE DINESH CHANDAN REDDY

7416767453 — gorredinesh21@gmail.com — GitHub — Portfolio

Data / AI Engineer at Reliance Industries — enterprise data platforms (Azure, Databricks) and GenAI systems (RAG, agents, voice); independently builds and operates a live AI-powered marketplace.

Education

Indian Institute of Technology (ISM), Dhanbad — Bachelor of Technology, Computer Science and Engineering *Dec 2021 – May 2025*

Experience

Reliance Industries Ltd.
Aug 2025 – Present
Graduate Engineer Trainee (Data / AI Engineer) *Mumbai, India*

- **Ask Questions in Plain English** — Business users can now ask questions in normal English and get answers straight from company data — no SQL, no BI tool. (Built by extending **Databricks Genie** beyond its own platform.)
- **Answers from the Right Data** — When anyone asks a question, the system works out which of the company's many databases actually holds the answer and asks only there — so every answer comes from the right place. (A **metadata-graph routing layer** I designed.)
- **Answers by Voice** — Users speak their question and hear the answer out loud — the same data platform, hands-free. (Real-time **speech-to-text and text-to-speech**.)
- **A Production App, Not a Demo** — Built the web application that delivers all of this outside Databricks — secure sign-in and clean APIs — running as real production software. (OAuth 2.0, REST services.)
- **Three Systems Became One** — Connected factory (MES), SAP and workforce data into a single platform, so everything downstream reads from one trusted place instead of three. (Production pipelines on **Azure Data Factory, ADLS Gen2 and Databricks**.)
- **Raw Data into Trusted Tables** — Owned the full journey of company data — from raw ingested files to clean, checked tables that reports and KPIs are built on. (**Delta Lake's** Bronze–Silver–Gold flow in Azure Databricks.)
- **From Factory Data to Dashboards** — Shipped MES analytics as datasets, KPI notebooks and **Databricks dashboards** for manufacturing operations.
- **Workforce at a Glance** — Delivered attendance, attrition and workforce metrics as **Databricks dashboards** for workforce reporting.

Pepsales
Apr 2024 – May 2024
Backend / AI Intern *Bengaluru, India*

- **The Company's First AI Product** — As their first engineering intern, built the AI proof-of-concept end to end: it reads recorded sales calls and turns them into **structured customer insights** — pain points, requirements — using LLM prompts I designed.
- **Built Before the Tools Existed** — Owned every piece myself — reading documents, designing prompts, connecting the AI — **before frameworks like LangChain**, so every part was built from scratch.
- **Deployed, Then Adopted** — Put the services live on AWS — and the flow I built **became the core flow of the product**. (Flask on EC2.)
- **Built for a Real Product** — The pipeline fed a **B2B SaaS platform that generates personalized product demos** — raw sales calls became the inputs those demos needed.

Projects

Homatri — Hyperlocal Home-Food Marketplace | Next.js, FastAPI, React Native, PostgreSQL, GCP Cloud Run, WhatsApp Business API, LangGraph, Razorpay | Website

- **Real Users, Real Orders** — Built — and personally run — a live home-food marketplace doing **40–50 orders a day** with **50+ registered home chefs**: customers order, home chefs cook, riders deliver.
- **A Full Platform, Web and Mobile** — One website plus **3 Android apps** (customers, chefs, riders) on a single backend, covering ordering, payments, live location and delivery. (Next.js, FastAPI, PostgreSQL.)
- **Ordering Food by Chatting on WhatsApp** — Customers text an AI assistant like a friend: it shows tonight's menu, builds the order, sends a **working payment link** and tracks delivery to the door — all inside one chat, no app needed. (A **LangGraph** AI agent on the WhatsApp Business API, wired to the same backend as the apps.)
- **Voice Notes Become Orders** — Customers can simply **speak** their order as a voice note; a safety check I added stops the AI inventing orders when it cannot hear properly. Replies arrive in about **3 seconds**. (Gemini on Vertex AI, tuned for speed.)
- **Payments Done Right** — Merged an earlier 4-agent design into a single assistant — and deliberately kept money out of the AI's hands: the **system**, not the AI, creates each Razorpay link, and an order is confirmed only after the payment gateway itself reports the payment. (Server-side webhooks + polling.)
- **Watching Your Order Live** — Customers see their order update in real time and their rider's GPS location on a map; the whole platform runs on Google Cloud with one-command deploys. (SSE updates, WebSocket GPS, Cloud Run + Cloud SQL.)

Feynman — Personal AI Companion Harness | Python, Gemini Live API (Vertex AI), SQLite + sqlite-vec, FastAPI, Android, LangGraph | GitHub

- **A Voice Assistant You Can Interrupt** — It talks and listens in real time — interrupt it mid-sentence and it stops, like a person. Open-sourced under **MIT**. (Full-duplex voice on Google's **Gemini Live API**.)
- **It Remembers Every Conversation** — Like a person, it keeps memories: each day's chats are sorted overnight into a personal memory of **2,178 notes** it can search and recall weeks later — proven with a **21/21 memory-recall test**. (Three-tier memory with vector search.)
- **19 Tools, with a Safety Switch** — It can take notes, read files, run commands and start tasks — but anything destructive must first be **spoken out loud and approved**, and dangerous commands are blocked outright. (Per-tool confirmation gates + blocklists.)
- **The Phone Controls the Laptop** — From an Android app, the AI runs the laptop remotely: commands land behind an **Allow/Deny button on the phone**, it **sees the screen** through screenshots, and it can start, check and stop coding tasks on its own. (Token-secured FastAPI bridge on a private network.)
- **It Runs Another AI** — Reverse-engineered an **undocumented protocol** to command a desktop coding agent — with **36 automated tests** that caught 2 real bugs before release. (JSON-RPC sessions, permissions, prompts.)

Open-Source Contributions

- **opencode** (TypeScript, MIT, ∼217k stars) — PR #55322: caches compiled wildcard-pattern regexes to cut repeated pattern-matching overhead.
- **BrogueCE** (C, AGPL-3.0, ∼1.5k stars) — PR #918: hardened recording-playback and score-file I/O, defects found with **gcc -fanalyzer static analysis** (+70/8 across 5 files).
- **eino-ext** (Go, Apache-2.0, 825 stars) — PR #1023: fixed a **data race** where `toTools` mutated the shared tool schema (+131/2).

Technical Skills

Languages: Python, Go, SQL, TypeScript / JavaScript, C / C++
Data Engineering: Azure Databricks, Delta Lake (Medallion), Apache Spark / PySpark, Azure Data Factory, ADLS Gen2, PostgreSQL
AI / GenAI Engineering: LangGraph, LangChain, RAG, function / tool calling, prompt engineering, Gemini / Vertex AI, LLM evaluation, MCP, Ollama
ML / Deep Learning: PyTorch, TensorFlow / Keras, NumPy, Pandas, computer vision, GANs
Cloud / Integrations / Delivery: GCP (Cloud Run, Cloud SQL, Vertex AI), AWS, Docker, CI/CD, WhatsApp Business API, Razorpay, OAuth, WebSockets / SSE

Achievements

- **Amazon ML Challenge 2024** (Amazon India) — finished in the **top ∼1% of 18,500+ teams** in a 72-hour national ML hackathon (OCR-based entity extraction over 260k product images)
- **Paytm Build for India AI Hackathon 2026**, Mumbai — selected among the **top 15 of ∼6,000 entries** for the in-person finale; built **Sahayak**, an autonomous UPI payment-failure support agent (LLM triage with deterministic SLA rails, automated NPCI dispute filing, voice in 5 Indian languages)
- **Codeforces** rating **1600+ (Expert)** · **500+ LeetCode** problems solved
- Secured AIR **2903** in JEE Advanced and AIR **4616** in JEE Main
